## ***Descripción de los Métodos de Muestreo y Análisis***

Para el análisis químico, se recolectaron muestras de suelo, vegetación nativa, invertebrados terrestres y peces. A continuación se presenta una breve descripción de los métodos de muestreo en campo y análisis de laboratorio realizados para este estudio. Al final de este Apéndice, se presentan los métodos de muestreo detallados (Instrucciones Específicas para el Trabajo) y los reportes de muestreo de campo para suelo, cultivos, vegetación e invertebrados terrestres. Los métodos de muestreo detallados para peces se presentan en los Anexos XIV (peces de agua dulce y su hábitat) y XV (biología marina). En el Anexo XIX, Apéndice Aii se presentan los métodos analíticos de laboratorio y de aseguramiento de la calidad/control de calidad (QA/QC) detallados, los límites de detección específicos, los resultados analíticos, y los resultados de QA/QC.

### **Colecta de Suelos, Cultivos y Vegetación**

Del 25 al 29 de agosto de 2008 se recogieron muestras de suelos, cultivos y vegetación. En total se recogieron muestras en tres comunidades humanas (Los Molejones, Coclesito/ Villa del Carmen y Río Caimito<sup>1</sup>) y en ocho emplazamientos no comunitarios que fueron seleccionados para representar una serie de hábitats de receptores de vida silvestre. Las ubicaciones de muestreo se muestran en el Mapa 4 del Anexo I. En cada ubicación, se recogieron muestras de suelo y plantas de dos especies. Para cada especie de planta muestreada, se recogieron muestras separadas del follaje y de otro tejido comestible (por ejemplo, frutos, semillas, tubérculos). Cada muestra de suelo o planta fue un compuesto homogenizado de múltiples submuestras (por ejemplo, cucharadas de suelo, cortes de hojas) tomadas de varias ubicaciones dentro de un área de aproximadamente 5 x 5 m. Todas las muestras de este compuesto homogenizado fueron recogidas por duplicado. Las muestras fueron recogidas en bolsas de plástico nuevas con cierres herméticos, etiquetadas, y almacenadas en hielo o congeladas hasta su envío.

Entre las especies de plantas muestreadas en comunidades humanas se encuentran el arroz (*Oryza sativa*), la yuca (*Manihot esculenta* Crantz) y el guineo (*Musa paradisiaca*). Las especies de plantas muestreadas que representan la dieta de la vida silvestre herbívora incluyeron las plantas con flores del género *Psychotria* (*P. acuminata*, *P. erecta*, *P. solitudinum*), *Vismia bilbergiana*, especie *Heliconia*, *Attalea allenii*, *Pentagonia macrophylla*, *Siparuna conica*, especie *Calyptrigine*, *Prestoea decurrens*, *Guatteria amplifolia*, Melastomoatoaceae, *Solanum rudepanum*, *Amphirox longifolia* y especie *Clusia*. Las identificaciones de especies proporcionadas en el reporte de muestreo de campo (al final del presente Apéndice) son identificaciones de campo

---

<sup>1</sup> Se recogieron muestras de suelo y vegetación en siete ubicaciones dentro de las siguientes tres comunidades: Río Caimito (1 estación); Los Molejones (4 estaciones); Coclesito/Villa del Carmen (2 estaciones).

preliminares, las cuales fueron confirmadas o corregidas al momento de la exportación mediante la inspección de las muestras colectadas. Se confirmó la identificación de las especies mediante la inspección de las fotografías de las muestras recibidas por el laboratorio analítico, proporcionadas por el laboratorio analítico a solicitud de Golder.

### **Colecta de Invertebrados Terrestres**

Se recogieron muestras de suelo y de invertebrados terrestres el 25 y 26 de abril del 2009. En total se recogieron muestras en siete ubicaciones en el área de Valle Grande. En cada ubicación se separaron los invertebrados terrestres de la tierra/hojarasca retirando manualmente o tamizando la tierra/hojarasca con un tamiz de malla gruesa. Se recogieron muestras por duplicado del suelo y de los invertebrados terrestres en bolsas de plástico con cierre hermético y se almacenaron en hielo o se congelaron hasta su envío. Un entomólogo identificó en campo los invertebrados colectados. Se confirmó la identificación de las especies mediante la inspección de las fotografías de las muestras tomadas durante la colecta.

La principal especie de invertebrados terrestres muestreada fue la lombriz de tierra (*Lumbricus terrestris*). Se encontró un número suficiente de lombrices de tierra en todos los sitios para alcanzar la masa de tejido requerida para el análisis químico. En el reporte de muestreo de campo al final del presente apéndice se resumen las demás especies recogidas (y archivadas para un posible análisis futuro).

### **Colecta de Peces**

Las ubicaciones del muestreo de peces se muestran en el Mapa 17 del Anexo I y mayores detalles de las ubicaciones y métodos de muestreo se presentan en los Anexos XIV (peces de agua dulce y hábitats de peces) y XV (biología marina). Se recogieron muestras de peces de agua dulce en 20 ubicaciones del 16 al 26 de septiembre de 2007, y del 10 al 18 de marzo de 2008. Las especies recogidas fueron sábalo pipón (*Brycon chagrensis*), guavina (*Gobiomorus dormitor*), cuyamel (*Joturus pichardi*), jurel de ojo (*Caranx latus*) y cojinúa negra (*Caranx crissus*). Las especies marinas recogidas incluyeron rayas (Batoidea), mojarra (*Diapterus plumieri*, *Gerres cinereus*), ronco blanco (*Biardiella rhonchus*) y jurel (*Trachurus trachurus*). Un retraso en aduanas durante el embarque ocasionó un descongelamiento parcial de un primer envío de batoideos y *Diapterus plumieri*. De acuerdo con la recomendación del laboratorio analítico, estas muestras fueron retenidas para el análisis de metales y contaminantes orgánicos no volátiles persistentes (pesticidas, bifenilos policlorados [PCB]) pero fueron consideradas potencialmente comprometidas con respecto a los hidrocarburos aromáticos policíclicos de mayor volatilidad (PAH). Se envió un embarque adicional al laboratorio para el análisis completo de metales y contaminantes orgánicos, incluyendo hidrocarburos aromáticos policíclicos.

**Análisis de Laboratorio**

Todas las muestras se enviaron a ALS Environment Ltd. (Burnaby, British Columbia, Canadá; acreditado por la Canadian Association for Laboratory Accreditation (Asociación Canadiense para la Acreditación de Laboratorios [CALA]) para su análisis químico. Todas las muestras biológicas se analizaron como homogeneizados de tejido (hojas o fruta) o cuerpo entero (peces o invertebrados terrestres), con excepción de algunos batoideos con cuerpos de gran tamaño que no pueden homogeneizarse enteros y que fueron analizados como submuestras homogeneizadas de tejido muscular. Todas las muestras se analizaron para obtener el contenido de humedad y la gama completa de metales. Se analizaron mercurio y selenio mediante métodos de bajo nivel. Se analizó un subconjunto de muestras (aproximadamente de 10 a 20% del total) para detectar metales y una gama de contaminantes orgánicos, incluyendo pesticidas organoclorados, bifenilos policlorados (total de PCB y arocloros), y PAH. Los métodos analíticos de laboratorio y de aseguramiento de calidad/control de calidad (QA/QC) detallados, los límites de detección específicos de muestras, y los resultados de los análisis y del QA/QC se presentan en el Anexo XIX, Apéndice B.

### NECESIDADES DE MUESTREO DE SUELO Y VEGETACIÓN PARA LA EVALUACIÓN DE RIESGO A LA SALUD HUMANA Y A LA ECOLOGÍA

Día: 4-octubre-2008

Coordenadas UTM: 0538538  
0980036

Planta Muestreado: Palma de hojas suaves y tallo verde

Muestra realizadas a Orilla de un arroyo.

- 2 muestras duplicadas de **Suelo** para el análisis **Orgánico**
- 2 muestras duplicadas de **Hojas** para análisis **Orgánico**
- 2 muestra del **Fruto** para análisis **Orgánico**
- 2 muestras duplicadas de **Suelo** para análisis de **Metales**
- 2 muestras duplicadas de **Hojas** para análisis de **Metales**
- 2 muestras del **Fruto** para análisis de **Metales**.

Los frutos de estas plantas son consumidos por lo general por la ardilla (*Sciuridae*) y por el ratón de bolsa (*Heteromysidae*).

Las 12 muestras se encuentran congeladas en el refrigerador.

**Coordenadas UTM:** 0538538  
0980036

**Planta Muestreado:** *Amphirrox Longifolia*

Muestra realizadas en un Bosque Primario

- 2 muestras duplicadas de **Suelo** para el análisis **Orgánico**
- 2 muestras duplicadas de **Hojas** para análisis **Orgánico**
- 2 muestras duplicadas de **Suelo** para análisis de **Metales**
- 2 muestras duplicadas de **Hojas** para análisis de **Metales**

Las 8 muestras se encuentran congeladas en el refrigerador.

**Planta Muestreada:** *Clusia*

- 2 muestras duplicadas de **Frutos** para el análisis **Orgánico**
- 2 muestras duplicadas de **Frutos** para análisis de **Metales**

Las 4 muestras se encuentran congeladas en el refrigerador.

No se pudo identificar qué animal puede consumir este fruto.

**Coordenadas UTM: 0539137  
0978302**

Planta Muestreada: **Metastomatacea GHC - 001**

Muestra realizadas en un Bosque Primario

- 2 muestras duplicadas de **Suelo** para el análisis **Orgánico**
- 2 muestras duplicadas de **Hojas** para análisis **Orgánico**
- 2 muestras duplicadas de **Frutos** para análisis de **Orgánico**

| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |                                                                                           |  |
| 1) Recorrer el lugar de la muestra y seleccionar una ubicación representativa del suelo con dos especies de plantas que sean más comunes en la zona y que probablemente sean consumidas por seres humanos y/o animales silvestres (de preferencia con bayas, frutos, semillas o nueces). Además, anotar cualquier observación de vida silvestre o señales de la presencia de vida silvestre.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |                                                                                           |  |
| 2) Etiquetar una bolsa de plástico con cierre hermético con el número de muestra (según han sido identificadas en la lista de número de muestras adjunta), la ubicación y la fecha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |                                                                                           |  |
| 3) Usar guantes de nitrilo cada vez que tenga contacto con las plantas y cambiar los guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |                                                                                           |  |
| <p>4) Seleccionar un área de aproximadamente 5 m x 5 m y tome muestras de hojas y bayas/frutos/semillas de dos especies de planta preferentes que sean utilizadas potencialmente por seres humanos (por ejemplo, para consumo o uso medicinal) o receptores ecológicos.</p> <p>Con las tijeras limpias para cortar las partes superiores de las plantas (hojas y puntas de brotes), recoger compuestos de diferentes plantas (por ejemplo, 5). Anotar el número y tipo de plantas. Anotar si cualquiera de las plantas no luce saludable – los síntomas incluyen manchas amarillas, agujeros en las hojas, plantas débiles. De cada una de las ubicaciones de muestreo, recolectar dos veces el volumen de material, mezclar y dividir en dos bolsas etiquetadas por separado como muestras individuales para el aseguramiento de la calidad. Especificar qué muestra es el duplicado en las notas de campo. En caso no sea posible obtener plantas de la misma ubicación para cada uno de los duplicados, documentar en las notas de campo.</p> |  |                                                                                           |  |
| 5) Llenar completamente una bolsa de plástico con cierre hermético de tamaño mediano con hojas y bayas/frutos/nueces/semillas y cerrar herméticamente.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |                                                                                           |  |
| 6) Colocarla dentro de otra bolsa de plástico con cierre hermético, colocar una etiqueta de papel más detallada dentro de la bolsa exterior y cerrarla herméticamente.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |                                                                                           |  |

## Notas de Campo e Instrucciones Específicas del Trabajo

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7) Limpiar las hojas de las tijeras y del cuchillo con una solución detergente, Enjuagar con agua destilada. Secar con un paño tipo J-cloth limpio.                                                                                                                                                                                                                                                                                                                               |
| 8) De ser posible, llevar un cooler y compresas de hielo al campo para almacenar las muestras durante el día. En las noches, transferirlas a un congelador hasta su envío al laboratorio. Si no existe espacio para un cooler, colocar las muestras en una bolsa para basura limpia y mantenerla tan fría como sea posible.                                                                                                                                                       |
| Precauciones: Asegurarse de manipular siempre las plantas con guantes y preferiblemente con ningún objeto de metal (para el análisis de metales). Cambiar de guantes entre la toma de muestras. No utilizar ninguna planta que se haya caído al suelo de manera accidental, recolectar una nueva.                                                                                                                                                                                 |
| <b>Ubicaciones de muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1) Hojas y bayas – Dieciocho ubicaciones de muestreo en el área del proyecto para la colecta de hojas y bayas/frutos/semillas/nueces. Las muestras de hojas y bayas/frutos/semillas/nueces deben provenir de las mismas plantas. Se deberá seleccionar las ubicaciones de manera que éstas reflejen el uso local y ambiente ecológico pero deben tener una cobertura vegetal adecuada para obtener todas las muestras necesarias. Duplicar las muestras en todas las ubicaciones. |
| 2) Obtener las ubicaciones que figuran en la unidad GPS para cada ubicación de muestreo y registrarlas en el siguiente cuadro.                                                                                                                                                                                                                                                                                                                                                    |
| 3) Tomar fotografías de cada planta, la ubicación de la muestra y del área en general.                                                                                                                                                                                                                                                                                                                                                                                            |
| 4) Completar una Hoja de Identificación de Muestras para cada ubicación (ver modelo adjunto).                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Instrucciones de envío:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.                                                                                                                                                                                                                                                                                                                                                           |
| 2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar la intención de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar, con copia a Mike Rankin.                                                                                                                                                                                   |
| 3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>“SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN”</b> . Se deberá añadir un valor nominal de \$20 en el formulario de declaración.                                                                                                                                                                                                                     |
| <b>Cadena de custodia:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1) Asegurarse de que la cadena de custodia incluya los códigos de los análisis indicados en la tabla a continuación                                                                                                                                                                                                                                                                                                                                                               |
| 2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b>“Muestras de plantas. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates Vancouver, 604-986-4331 para obtener instrucciones para los análisis”</b> .                                                                                                                                                                                                                |
| 3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn, así como una copia a Mike Rankin antes del envío de las muestras.                                                                                                                                                                                                                                                                                                                               |
| 4) Asegurarse además de que haya una nota resaltada que indique que se debe lavar la vegetación (enjuagar con agua destilada).                                                                                                                                                                                                                                                                                                                                                    |

## Números de las Muestras:

| Descripción de la Muestra | Hojas          | Bayas/Frutos/<br>Nueces/Semillas | Ubicaciones en<br>GPS |
|---------------------------|----------------|----------------------------------|-----------------------|
| Especie #1                | SRLM - 1a, b   | SRBM - 1 a, b                    |                       |
|                           | SRLM - 2 a, b  | SRBM - 2 a, b                    |                       |
|                           | SRLM - 3 a, b  | SRBM - 3 a, b                    |                       |
|                           | SRLM - 4 a, b  | SRBM - 4 a, b                    |                       |
|                           | SRLM - 5 a, b  | SRBM - 5 a, b                    |                       |
|                           | SRLM - 6 a, b  | SRBM - 6 a, b                    |                       |
|                           | SRLM - 7 a, b  | SRBM - 7 a, b                    |                       |
|                           | SRLM - 8 a, b  | SRBM - 8 a, b                    |                       |
|                           | SRLM - 9 a, b  | SRBM - 9 a, b                    |                       |
| Especie #2                | SRLM - 10 a, b | SRBM - 10 a, b                   |                       |
|                           | SRLM - 11 a, b | SRBM - 11 a, b                   |                       |
|                           | SRLM - 12 a, b | SRBM - 12 a, b                   |                       |
|                           | SRLM - 13 a, b | SRBM - 13 a, b                   |                       |
|                           | SRLM - 14 a, b | SRBM - 14 a, b                   |                       |
|                           | SRLM - 15 a, b | SRBM - 15 a, b                   |                       |
|                           | SRLM - 16 a, b | SRBM - 16 a, b                   |                       |
|                           | SRLM - 17 a, b | SRBM - 17 a, b                   |                       |
|                           | SRLM - 18 a, b | SRBM - 18 a, b                   |                       |

**Envío:**

Enviar las muestras congeladas, embaladas con compresas de hielo, a:

ALS Laboratories  
1988 Triumph Street  
Vancouver, BC  
Canadá, V5L 1K5  
Tel: 1-(604)-253-4188 o 1-(800)-665-0243 (número gratuito)  
Correo electrónico: Vancouver@alsenviro.com

Incluir el formulario de la cadena de custodia con las siguientes instrucciones: ***“Muestras de plantas. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates North Vancouver, 604-986-4331 para obtener instrucciones para los análisis”. Asegurarse de que la cadena de custodia indique que se deben lavar las muestras (enjuagar con agua destilada).***

**Producto(s) de trabajo a ser entregado(s):** del 1 al 13 de junio de 2008.

**Horas-hombre asignadas:** actividad integrada con el muestreo de suelo.

**Subcontratista (según corresponda):** Ninguno.

**Requerimientos especiales para manipulación:** Mantener la muestra congelada o tan fría como sea posible.

**Especificaciones y procedimientos aplicables:** Ninguno.

**Aprobación del Gerente de Proyecto /Fecha:**      **Responsable de Control de Calidad/Fecha:**

**ANEXO XIX**

**APÉNDICE A-v**

**INSTRUCCIONES ESPECÍFICAS PARA EL TRABAJO**

**MUESTREO DE PLANTAS PARA ANÁLISIS ORGÁNICO**

| <b>Alcance de las instrucciones específicas/del trabajo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |                                                                                                                                             |
| <b>Objetivo:</b> El objetivo del muestreo de plantas es determinar las concentraciones de metales de línea base en las plantas que crecen en el área de estudio. También se requerirá tomar muestras del suelo superficial adyacente a la planta (ver SWI 3 y 4 para colecta de suelo). Los datos serán utilizados en la evaluación de riesgo de línea base para la salud humana y la ecología.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |                                                                                                                                             |
| <b>Suministros:</b> Frascos de vidrio limpios de 250 ml. Guantes descartables de nitrilo. Tijeras de acero inoxidable recubiertas de Teflón o de buena calidad. Cuchillo filoso de acero inoxidable. Varios paños tipo J-Cloths. Botellas de agua. Agua destilada. Detergente suave. Pala de acero inoxidable de buena calidad (no deberá tener ninguna escama de la pintura de recubrimiento en la superficie). Etiquetas preimpresas y etiquetas adicionales. Formularios para identificación de muestras. Unidad de sistema de posicionamiento global (GPS). Cooler y compresas de hielo. Cámara                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |                                                                                                                                             |
| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |                                                                                                                                             |
| 1) Recorrer el sitio de muestreo y seleccionar una ubicación de suelo representativa con dos especies de plantas que sean las más comunes en la zona y que probablemente sean consumidas por seres humanos y/o animales silvestres (de preferencia con bayas, frutos, semillas o nueces). Además, anotar cualquier observación de vida silvestre o señales de la presencia de vida silvestre.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |                                                                                                                                             |
| 2) Etiquetar un frasco de vidrio de 250 ml para cada muestra con el número de muestra (según han sido identificadas en la lista de número de muestras adjunta), la ubicación y la fecha. Un frasco para muestras de hojas y otro para las muestras de bayas/frutos/nueces/semillas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |                                                                                                                                             |
| 3) Usar guantes de nitrilo cada vez que tenga contacto con las plantas y cambiar de guantes entre la toma de muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |                                                                                                                                             |
| 4) Seleccionar un área de aproximadamente 5 m x 5 m y tomar muestras de hojas y bayas/frutos/semillas de dos especies de planta preferentes que sean utilizadas potencialmente por seres humanos (por ejemplo, para consumo o uso medicinal) o receptores ecológicos en áreas que estén cerca de zonas agrícolas, vías o poblados. Las ubicaciones de muestreo deberán corresponder a aquellas en los que se han recolectado suelo y vegetación para el análisis de metales.<br><br>Con las tijeras limpias para cortar las partes superiores de las plantas (hojas y puntas de brotes), recolectar compuestos de diferentes plantas (por ejemplo, 5). Anotar el número y tipo de plantas. Anotar si cualquiera de las plantas no luce saludable – los síntomas incluyen manchas amarillas, agujeros en las hojas, plantas débiles.<br><br>De cada una de las ubicaciones de muestreo, recolectar dos veces el volumen de material, mezclar y dividir en dos bolsas etiquetadas por separado como muestras individuales para el aseguramiento de la calidad. Especificar qué muestra es el duplicado en las notas de campo. En caso no sea posible obtener plantas de la misma ubicación para cada uno de los duplicados, documentar en las notas de campo. |  |                                                                                                                                             |

## Notas de Campo e Instrucciones Específicas del Trabajo

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5) Llenar completamente un frasco de vidrio de 250 ml con hojas y otro con bayas/frutos/nueces/semillas, en caso estén disponibles, y cerrar herméticamente los frascos.                                                                                                                                                                                                                                                                                                     |
| 6) Limpiar las hojas de las tijeras y del cuchillo con una solución detergente, Enjuagar con agua destilada. Secar con un paño tipo J-cloth limpio.                                                                                                                                                                                                                                                                                                                          |
| 7) De ser posible, llevar un cooler y compresas de hielo al campo para almacenar las muestras durante el día. En las noches, transferirlas a un congelador hasta su envío al laboratorio. Si no existe espacio para un cooler, colocar las muestras en una bolsa para basura limpia y mantenerla tan fría como sea posible.                                                                                                                                                  |
| Precauciones: Asegurarse de manipular siempre las plantas con guantes. Cambiar los guantes entre la toma de muestras. No utilizar ninguna planta que se haya caído al suelo de manera accidental, recolectar una nueva.                                                                                                                                                                                                                                                      |
| <b>Ubicaciones de muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 1) Hojas y bayas – Tres ubicaciones de muestreo en el área del proyecto para la colecta de hojas y bayas/frutos/semillas/nueces. Las muestras de hojas y bayas/frutos/semillas/nueces deben provenir de las mismas plantas. Se deberá seleccionar las ubicaciones de manera que éstas reflejen el uso local y ambiente ecológico pero deben tener una cobertura vegetal adecuada para obtener todas las muestras necesarias. Duplicar las muestras en todas las ubicaciones. |
| 2) Obtener las ubicaciones que figuran en la unidad GPS para cada ubicación de muestreo y registrarlas en el siguiente cuadro.                                                                                                                                                                                                                                                                                                                                               |
| 3) Tomar fotografías de cada planta, la ubicación de la muestra y del área en general.                                                                                                                                                                                                                                                                                                                                                                                       |
| 4) Completar una Hoja de Identificación de Muestras para cada ubicación (ver modelo adjunto).                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Instrucciones de envío:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.                                                                                                                                                                                                                                                                                                                                                      |
| 2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar la intención de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar, con copia a Mike Rankin.                                                                                                                                                                              |
| 3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>“SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN”</b> . Se deberá añadir un valor nominal de \$20 en el formulario de declaración.                                                                                                                                                                                                                |
| <b>Cadena de custodia:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1) Asegurarse de que la cadena de custodia incluya los códigos de los análisis indicados en la tabla a continuación                                                                                                                                                                                                                                                                                                                                                          |
| 2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b>“Muestras de plantas. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates Vancouver, 604-604-986-4331 para obtener instrucciones para los análisis”</b> .                                                                                                                                                                                                       |
| 3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn, así como una copia a Mike Rankin antes del envío de las muestras.                                                                                                                                                                                                                                                                                                                          |
| 4) Asegurarse además de que exista una nota resaltada que indique que se debe lavar la vegetación (enjuagar con agua destilada).                                                                                                                                                                                                                                                                                                                                             |

### Número de las Muestras

| Descripción de la Muestra | Hojas        | Bayas/Frutos/<br>Nueces/Semillas | Ubicación en<br>GPS |
|---------------------------|--------------|----------------------------------|---------------------|
| Especie #1                | SRLO – 1 a,b | SRBO - 1 a,b                     |                     |
| Especie #2                | SRLO – 2 a,b | SRBO - 2 a,b                     |                     |

#### Envío:

Enviar las muestras congeladas, embaladas con compresas de hielo, a:

ALS Laboratories  
 1988 Triumph Street  
 Vancouver, BC  
 Canadá, V5L 1K5  
 Tel: 1-(604)-253-4188 o 1-(800)-665-0243 (llamada gratuita)  
 Correo electrónico: Vancouver@alsenviro.com

Incluir el formulario de la cadena de custodia con las siguientes instrucciones: “**Muestras de plantas. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates North Vancouver, 604-986-4331 para obtener instrucciones para los análisis**”. Asegurarse de que la cadena de custodia indique que se deben lavar las muestras (enjuagar con agua destilada).

**Producto(s) de trabajo a ser entregado(s):** del 1 al 13 de junio de 2008.

**Horas-hombre asignadas:** actividad integrada con el muestreo de suelo.

**Subcontratista (según corresponda):** Ninguno.

**Requerimientos especiales para manipulación:** Mantener la muestra congelada o tan fría como sea posible.

**Especificaciones y procedimientos aplicables:** Ninguno.

**Aprobación del Gerente de Proyecto /Fecha:**      **Responsable de Control de Calidad/Fecha:**

| <b>Objetivo:</b> El objetivo del muestreo de suelo es determinar las concentraciones de metales en el sustrato en el que crecen las plantas. Estos datos serán utilizados para determinar los factores de absorción de los metales del sustrato con respecto a las hojas y las bayas/frutos.                                                                                                                                                                                                                                                                                                                                                                         |                                                                                           |                  |
| <b>Suministros:</b> Bolsas de plástico aptas para alimentos con cierre hermético limpias para muestra (tamaño mediano). Guantes descartables de nitrilo. Tijeras de acero inoxidable recubiertas de Teflón o de buena calidad. Cuchillo filoso de acero inoxidable. Varios paños tipo J-Cloths. Botellas de agua. Agua destilada. Detergente suave. Pala de acero inoxidable de buena calidad (no debería tener ninguna escama de la pintura de recubrimiento en la superficie). Etiquetas preimpresas y etiquetas adicionales. Formularios para identificación de muestras. Unidad de sistema de posicionamiento global (GPS). Cooler y compresas de hielo. Cámara. |                                                                                           |                  |
| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                           |                  |
| 1) Etiquetar las bolsas de plástico con cierre hermético colocando el número de muestra (según han sido identificadas en la lista de número de muestras adjunta), la ubicación y la fecha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                           |                  |
| 2) Usar guantes de nitrilo cada vez que haya contacto con el suelo y cambiar de guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                           |                  |
| 3) Tomar muestras del suelo del área de las plantas de las que se está tomando muestras de hojas y raíces y otras muestras representativas del área de estudio. Tomar por lo menos 3 lampas, mezclándolas bien para obtener una muestra compuesta. Tomar muestras dobles en todas las ubicaciones.                                                                                                                                                                                                                                                                                                                                                                   |                                                                                           |                  |
| 4) Registrar la profundidad del suelo. Tomar la muestra de la profundidad del suelo si tiene menos de 10 cm de profundidad. Registrar las características del suelo (ver el formulario de identificación de muestras adjunto). Anotar la ubicación que figura en la unidad GPS. Tomar una fotografía en primer plano del lugar de la muestra del suelo. Llenar con tierra de ¼ a ½ la bolsa de plástico con cierre hermético (por lo menos 200 g).                                                                                                                                                                                                                   |                                                                                           |                  |
| 5) Sacar el aire de la bolsa y cerrarla herméticamente. Colocarla dentro de otra bolsa de plástico con cierre hermético, colocar una etiqueta de papel más detallada dentro de la bolsa externa y cerrarla herméticamente.                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                           |                  |
| 6) Entre muestras, limpiar la paleta con una solución detergente. Enjuagar con agua destilada. Secar con paño tipo J-cloth limpio.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                           |                  |
| 7) De ser posible, llevar un cooler y compresas de hielo al campo para almacenar las muestras durante el día. Las muestras del suelo deben colocarse en un cooler con compresas de hielo para ser transportadas al laboratorio. Si no existe espacio para un cooler, colocar las muestras en una bolsa para basura limpia y mantenerla tan fría como sea posible.                                                                                                                                                                                                                                                                                                    |                                                                                           |                  |
| <b>Precauciones:</b> Asegurarse de manipular siempre la tierra con guantes y nunca con objetos de metal (salvo que hayan sido lavados minuciosamente). Cambiar de guantes entre la toma de muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                           |                  |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ubicaciones de muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p>1) Dieciocho muestras de ubicaciones donde se recogieron hojas de plantas y bayas/frutos/nueces/semillas. La lógica para seleccionar estas áreas es representar las concentraciones de metales de línea base en el lugar y, por lo tanto, las ubicaciones deberán reflejar el uso local y el ambiente ecológico. Duplicar las muestras en todas las ubicaciones.</p> <p>2) Diecinueve muestras adicionales de las áreas cerca a comunidades, carreteras y zonas agrícolas. Duplicar las muestras en todas las ubicaciones.</p> <p>3) Registrar las ubicaciones que figuran en la unidad GPS para cada ubicación de muestreo en la tabla a continuación.</p> <p>4) Completar una Hoja de Identificación de Muestras para cada ubicación (ver modelo adjunto).</p> |
| <b>Instrucciones de envío:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p>1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.</p> <p>2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar la intención de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar, con copia a Mike Rankin.</p> <p>3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>“SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN”</b>. Se deberá añadir un valor nominal de \$20 en el formulario de declaración.</p>                                                           |
| <b>Cadena de custodia:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>1) Asegurarse de que la cadena de custodia incluya los códigos de los análisis indicados en la tabla a continuación</p> <p>2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b>“Muestras de suelo. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates Vancouver, 604-296-4200 para obtener instrucciones para los análisis”</b>.</p> <p>3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn, así como una copia a Mike Rankin antes del envío de las muestras.</p>                                                                                                                                                                                                        |

**Números de las Muestras:**

| Descripción de la Muestra          | Suelo         | Ubicaciones en GPS |
|------------------------------------|---------------|--------------------|
| Especies de Plantas #1             | SRSM - 1 a,b  |                    |
|                                    | SRSM - 2 a,b  |                    |
|                                    | SRSM - 3 a,b  |                    |
|                                    | SRSM - 4 a,b  |                    |
|                                    | SRSM - 5 a,b  |                    |
|                                    | SRSM - 6 a,b  |                    |
|                                    | SRSM - 7 a,b  |                    |
|                                    | SRSM - 8 a,b  |                    |
|                                    | SRSM - 9 a,b  |                    |
| Especies de Plantas #2             | SRSM - 10 a,b |                    |
|                                    | SRSM - 11 a,b |                    |
|                                    | SRSM - 12 a,b |                    |
|                                    | SRSM - 13 a,b |                    |
|                                    | SRSM - 14 a,b |                    |
|                                    | SRSM - 15 a,b |                    |
|                                    | SRSM - 16 a,b |                    |

## Notas de Campo e Instrucciones Específicas del Trabajo

**Envío:**

Enviar las muestras congeladas, embaladas con compresas de hielo, a:

ALS Laboratories  
1988 Triumph Street  
Vancouver, BC  
Canadá, V5L 1K5  
Tel: 1-(604)-253-4188 o 1-(800)-665-0243 (número gratuito)  
Correo electrónico: Vancouver@alsenviro.com

Incluir el formulario de la cadena de custodia con las siguientes instrucciones: ***“Muestras de suelo. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates North Vancouver, 604-296-4200 para obtener instrucciones para los análisis”.***

| <b>Alcance de las instrucciones específicas/del trabajo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |                                                                                           |
| <b>Objetivo:</b> El objetivo del muestreo de suelos es determinar las concentraciones de materiales orgánicos en el sustrato en el que crecen plantas. Estos datos serán utilizados para determinar los factores de absorción de materiales orgánicos del sustrato con respecto a hojas y bayas/frutos.                                                                                                                                                                                                                                                                                             |  |                                                                                           |
| <b>Suministros:</b> Frascos de vidrio limpios de 250 ml. Guantes descartables de nitrilo. Tijeras de acero inoxidable recubiertas de Teflón o de buena calidad. Cuchillo filoso de acero inoxidable. Varios paños tipo J-Cloths. Botellas de agua. Agua destilada. Detergente suave. Pala de acero inoxidable de buena calidad (no deberá tener ninguna escama de la pintura de recubrimiento en la superficie). Etiquetas preimpresas y etiquetas adicionales. Formularios para identificación de muestras. Unidad de sistema de posicionamiento global (GPS). Cooler y compresas de hielo. Cámara |  |                                                                                           |
| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |                                                                                           |
| 1) Etiquetar los frascos de vidrio de 250 ml colocando el número de muestra (según han sido identificadas en la lista de número de muestras adjunta), la ubicación y la fecha.                                                                                                                                                                                                                                                                                                                                                                                                                      |  |                                                                                           |
| 2) Usar guantes de nitrilo cada vez que haya contacto con el suelo y cambiar de guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |                                                                                           |
| 3) Tomar muestras del suelo del área de las plantas de las que está tomando muestras de hojas y también otras áreas según se describe en la sección de ubicación de muestreo. Tomar por lo menos 6 lampas, mezclándolas bien para obtener una muestra compuesta y dividirla en dos frascos etiquetándolos separadamente como muestras individuales para control de calidad.                                                                                                                                                                                                                         |  |                                                                                           |
| 4) Registrar la profundidad del suelo. Tomar la muestra de la profundidad del suelo si tiene menos de 10 cm de profundidad. Registrar las características del suelo (ver el formulario de identificación de muestras adjunto). Anotar la ubicación que figura en la unidad GPS. Tomar una fotografía en primer plano del lugar de la muestra de suelo.                                                                                                                                                                                                                                              |  |                                                                                           |
| 5) Llenar completamente un frasco de vidrio de 250 mL con tierra y cerrar la tapa bien ajustada.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |                                                                                           |
| 6) Entre muestras, limpiar la paleta con una solución detergente. Enjuagar con agua destilada. Secar un con paño limpio tipo J-cloth.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |                                                                                           |
| 7) De ser posible, traer una nevera portátil y compresas de hielo al campo para almacenar las muestras durante el día. Las muestras de suelo deben colocarse en una nevera portátil con compresas de hielo para ser transportadas al laboratorio. Si no existe espacio para una nevera portátil, colocar las muestras en una bolsa para basura limpia y mantenerla tan fría como sea posible.                                                                                                                                                                                                       |  |                                                                                           |
| <b>Precauciones:</b> Asegurarse de que siempre se manipule la tierra con guantes y nunca con objetos de plástico. Cambiar de guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |                                                                                           |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ubicaciones de muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p>1) Dos muestras de las ubicaciones donde se recogieron hojas de plantas y bayas/frutos/nueces/semillas. La lógica para seleccionar estas áreas es representar las concentraciones de metales de línea base en el lugar y, por lo tanto, las ubicaciones deberán reflejar el uso local y el ambiente ecológico. Tomar muestras dobles en cada ubicación.</p> <p>2) Una muestra de "Otras Ubicaciones" - áreas cerca a comunidades, carreteras y zonas agrícolas. Tomar muestras dobles en esta ubicación.</p> <p>3) Obtener las ubicaciones que figuran en la unidad GPS para cada toma de muestras y anotarlas en la tabla.</p>                                                                      |
| <b>Instrucciones de envío:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.</p> <p>2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar el intento de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar, con copia a Mike Rankin.</p> <p>3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>"SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN"</b>. Se deberá añadir un valor nominal de \$20 en el formulario de declaración.</p> |
| <b>Cadena de custodia:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p>1) Asegurarse de que la cadena de custodia incluya los códigos de los análisis indicados en la tabla a continuación.</p> <p>2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b><i>"Muestras de suelo. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates North Vancouver, 604-986-4331 para obtener instrucciones para los análisis"</i></b>.</p> <p>3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn, así como una copia a Mike Rankin antes del envío de muestras.</p>                                                                                                                                  |

### Números de las Muestras:

| Descripción de la Muestra   | Suelo        | Ubicaciones en GPS |
|-----------------------------|--------------|--------------------|
| Especies de plantas #1      | SRSO – 1 a,b |                    |
| Especies de plantas #2      | SRSO – 2 a,b |                    |
| Otras ubicaciones de suelos | SRSO – 3 a,b |                    |

### Envío:

Enviar las muestras congeladas, embaladas con compresas de hielo, a:

ALS Laboratories

1988 Triumph Street  
 Vancouver, BC

Canadá, V5L 1K5  
 Tel: 1-(604)-253-4188 o 1-(800)-665-0243 (línea gratuita)  
 Correo electrónico: Vancouver@alsenviro.com

Incluir el formulario de la cadena de custodia con las siguientes instrucciones: ***“Muestras de suelo. Refrigerar y comunicarse con Adrian de Bruyn/Audrey Wagenaar, Golder Associates North Vancouver, 604-986-4331 para obtener instrucciones para los análisis”.***

**Producto(s) del trabajo a ser entregado(s):** del 1 al 13 de junio de 2008.

**Horas-hombre asignadas:** actividad integrada con el muestreo del suelo.

**Subcontratista (según corresponda):** Ninguno.

**Requisitos especiales para manipulación:** Mantener la muestra tan fría como sea posible.

**Especificaciones y procedimientos aplicables:** Ninguno.

**Aprobación del Gerente del Proyecto /Fecha:**

**Responsable del Control de Calidad /Fecha:**

| <b>Objetivo:</b> El objetivo del muestreo de invertebrados es determinar las concentraciones de metales de línea base en invertebrados asociados con suelos u hojarasca que viven en el área de estudio. También se necesitarán muestras de suelos superficiales y hojarascas de las mismas ubicaciones como muestras de invertebrados (ver la instrucción específica de trabajo separada [SWI]). Los datos se usarán en la evaluación de riesgo ecológico y humano de línea base.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |                         |
| <b>Suministros:</b> Bolsas de plástico aptas para alimentos con cierre hermético limpias para muestra (tamaño sándwich). Guantes descartables de nitrilo. Etiquetas preimpresas y etiquetas adicionales. Cuadernos de campo. Unidad de sistema de posicionamiento global (GPS). Cooler y compresas de hielo. Cámara. Tamices para suelo y/o otros equipos para recolección de insectos (las especificaciones serán determinadas por el entomólogo local de acuerdo a las condiciones del campo). Recipiente o bandeja para clasificar invertebrados. Balanza portátil para pesar muestras, de ser posible.                                                                                                                                                                                                                                                                                                                                                                                                                 |                              |                         |
| <b>Personal:</b> De ser posible, el entomólogo deberá acompañar al equipo de campo a seleccionar e identificar las especies muestreadas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |                         |
| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                              |                         |
| 1) Seleccionar la ubicación de la muestra con cobertura de suelo y/o de hojarasca que puedan contener invertebrados (es decir, no rocas/arena).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                              |                         |
| 2) Etiquetar dos (2) bolsas de plástico con cierre hermético y colocar el número de muestra, la ubicación que figura en la unidad GPS y la fecha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                              |                         |
| 3) Usar guantes de nitrilo cada vez que haya contacto con invertebrados y cambiar de guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |                         |
| 4) Separar los invertebrados del suelo/hojarasca utilizando técnicas adecuadas para especies presentes y características del suelo/hojarasca. Los métodos pueden incluir recolección o tamizado manual de suelos/hojarasca mediante un tamiz de malla gruesa. No conservar ningún espécimen que esté muy dañado (es decir, triturado) durante el muestreo (la pérdida de patas se puede admitir).<br>Conservar los invertebrados que presentan las siguientes características:<br>- Especies que consumen tierra/hojarasca de la superficie (por ejemplo, milpiés) o se alimentan de manera omnívora en suelo/hojarasca (por ejemplo, algunos escarabajos); <u>no</u> recolectar herbívoros/fungívoros o larvas acuáticas en etapa adulta, o depredadores que probablemente se alimentan de herbívoros/fungívoros o larvas acuáticas en etapa adulta (por ejemplo, no orugas, hormigas, termitas, arañas).<br>- Especies con movilidad limitada, de manera que residen en el área local (por ejemplo, dentro de unos pocos |                              |                         |

## Notas de Campo e Instrucciones Específicas del Trabajo

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>cientos de metros); no recolectar especies con alta movilidad.</p> <p>- Se prefieren las especies de cuerpo grande o abundante; de ser posible, recolectar una única especie (o taxón mayor, por ejemplo milpiés) en cada lugar. Si no hay un solo taxón que proporcione suficiente masa de tejido, combinar especies múltiples según se requiera para preparar las muestras.</p> <p>- De ser posible, recolectar las mismas especies o un taxón mayor (por ejemplo, milpiés) en todos los lugares.</p>                                                                                                                                                                     |
| <p>5) Colocar una muestra de invertebrados de 10-20 g en cada dos (2) bolsas de plástico con cierre hermético medianas etiquetadas (una muestra y una duplicada) y cerrarlas bien. Registrar la lista de especies en cada muestra en la etiqueta de la muestra y en las notas de campo.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| <p>6) Colocar cada una dentro de otra bolsa de plástico con cierre hermético, colocar una etiqueta de papel detallada (con la lista de especies y la ubicación que figura en la unidad GPS) dentro de la bolsa externa y cerrar herméticamente. Colocar inmediatamente en hielo para reducir la actividad de los invertebrados.</p>                                                                                                                                                                                                                                                                                                                                            |
| <p>7) Tan pronto como sea posible, trasladar las muestras a un congelador hasta su envío al laboratorio.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>Precauciones:</b> Asegurarse de que los invertebrados se manipulen siempre con guantes y preferiblemente con ningún objeto de metal (para análisis de metales). Cambiar de guantes entre muestras.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>Ubicaciones de muestreo:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p>1) Seleccionar de cinco a diez (5-10) ubicaciones para el muestreo en el área del lugar del proyecto. Las ubicaciones deberán ser seleccionadas para que reflejen una gradiente de distancia de las actividades existentes de la mina. Duplicar las muestras en todas las ubicaciones.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>2) Obtener las ubicaciones que figuran en la unidad GPS para cada ubicación de muestreo y registrarlas en las etiquetas de las muestras.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>3) Tomar fotografías de cada muestra de invertebrados (en el recipiente o la bandeja, de ser posible, para ver qué tipos de especies están presentes) así como de cada ubicación de la muestra.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p>4) Registrar las características del lugar, las especies recogidas, la fecha y las coordenadas que figuran en la unidad GPS en las notas de campo.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <p>1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.</p> <p>2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar el intento de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar.</p> <p>3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>“SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN”</b>. Se deberá añadir un valor nominal de \$20 en el formulario de declaración.</p> |
| <p><b>Formulario de la cadena de custodia:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p>1) Llenar el formulario adjunto de la cadena de custodia y <u>enviar este formulario con las muestras</u>.</p> <p>2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b>“Muestras de invertebrados. Refrigerar y comunicarse con Adrian deBruyn/Audrey Wagenaar, Golder Associates Burnaby, 604-296-4200 para obtener instrucciones para los análisis”</b>.</p> <p>3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn antes del envío de muestras.</p>                                                                                                                                                             |

**Envío:**

Enviar las muestras congeladas, embaladas con compresas de hielo, a:

ALS Laboratories  
1988 Triumph Street  
Vancouver, BC  
Canada, V5L 1K5  
Tel: 1-(604)-253-4188 or 1-(800)-665-0243 (línea gratuita)  
Correo electrónico: Vancouver@alsenviro.com

Incluir el formulario de la cadena de custodia con las siguientes instrucciones: ***“Muestras de invertebrados. Refrigerar y comunicarse con Adrian deBruyn/Audrey Wagenaar, Golder Associates Burnaby, 604-296-4200 para obtener instrucciones para los análisis”.***

**Producto(s) del trabajo a ser entregado(s):** abril de 2009.

**Horas-hombre asignadas:** actividad integrada con el muestreo del suelo.

**Subcontratista (de aplicarse):** Ninguno.

**Requisitos especiales para manipulación:** Mantener la muestra tan fría como sea posible.

**Especificaciones y procedimientos aplicables:** Ninguno.

**Aprobación del Gerente del Proyecto /Fecha:**

**Responsable del Control de Calidad /Fecha:**

| <b>Alcance de las instrucciones específicos/de trabajo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                               |                  |
| <b>Objetivo:</b> El objetivo del muestreo de suelos y hojarasca es determinar las concentraciones de metales en el sustrato en el que los invertebrados viven. Estos datos serán utilizados para determinar los factores de absorción de metales del sustrato con respecto a los invertebrados.                                                                                                                                                                                                               |                                                                                               |                  |
| <b>Suministros:</b> Bolsas de plástico aptas para alimentos con cierre hermético limpias para muestra (tamaño mediano). Guantes descartables de nitrilo. Botellas de agua. Agua destilada. Detergente suave. Paños limpios tipo J-Cloths. Pala de acero inoxidable de buena calidad (no debería tener ninguna escama de la pintura de recubrimiento en la superficie). Etiquetas preimpresas y etiquetas adicionales. Unidad de sistema de posicionamiento global (GPS). Cooler y compresas de hielo. Cámara. |                                                                                               |                  |
| <b>Instrucciones para el muestreo:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                               |                  |
| 1) En cada ubicación de muestreo de invertebrados, etiquetar cuatro (4) bolsas de plástico con cierre hermético colocando el número del lugar, la ubicación que figura en la unidad GPS y la fecha. Tomar muestras del área donde se recogieron los invertebrados. Tomar una fotografía en primer plano del lugar de la muestra de suelo.                                                                                                                                                                     |                                                                                               |                  |
| 2) Usar guantes de nitrilo cada vez que haya contacto con el suelo/la hojarasca y cambiar de guantes entre muestras.                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                               |                  |
| 3) Tomar una muestra de hojarasca de la superficie del suelo. Recolectar cualquier invertebrado visible, roca y ramita, pero teniendo cuidado de conservar el material orgánico fino. Llenar dos (2) bolsas de plástico con cierre hermético con hojarasca (una muestra y un duplicado). Tomar por lo menos 3 lampas de hojarasca, mezclándolas bien para obtener muestras compuestas.                                                                                                                        |                                                                                               |                  |
| 4) Tomar una muestra de suelo de los 5 cm superiores después de haber retirado la hojarasca. Llenar dos (2) bolsas de plástico con cierre hermético de ¼ a ½ con tierra (por lo menos 200 g cada una). Tomar por lo menos 3 lampas de tierra, mezclándolas bien para obtener muestras compuestas.                                                                                                                                                                                                             |                                                                                               |                  |
| 5) Sacar el aire de las bolsas y cerrarlas herméticamente. Colocar cada una dentro de otra bolsa de plástico con cierre hermético, colocar una etiqueta de papel dentro de la bolsa externa (con el número del lugar, el contenido de la muestra, la ubicación que figura en la unidad GPS y la fecha) y cerrarlas herméticamente.                                                                                                                                                                            |                                                                                               |                  |
| 6) Entre muestras, limpiar la paleta con una solución detergente. Enjuagar con agua destilada. Secar un con paño limpio tipo J-cloth.                                                                                                                                                                                                                                                                                                                                                                         |                                                                                               |                  |
| 7) De ser posible, mantener las muestras frías hasta que puedan ser trasladadas a un congelador. Mantenerlas congeladas hasta su envío.                                                                                                                                                                                                                                                                                                                                                                       |                                                                                               |                  |
| <b>Precauciones:</b> Asegurarse de que la tierra siempre se manipule con guantes y nunca con objetos de metal (salvo                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                               |                  |

## Notas de Campo e Instrucciones Específicas del Trabajo

|                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| que hayan sido lavados minuciosamente). Cambiar de guantes entre muestras.                                                                                                                                                                                            |
| <b>Ubicaciones de muestreo:</b>                                                                                                                                                                                                                                       |
| 1) Tomar una muestra (más el duplicado) del suelo y una muestra (más el duplicado) de hojarasca en cada ubicación de muestreo de invertebrados.                                                                                                                       |
| 2) Obtener las ubicaciones que figuran en la unidad GPS para cada ubicación de muestreo y registrarlas en las etiquetas de las muestras.                                                                                                                              |
| 3) Tomar fotografías de cada muestra de suelo y hojarasca, así como de cada ubicación de muestreo.                                                                                                                                                                    |
| 4) Registrar las características del lugar, las observaciones de la composición del suelo/hojarasca, la fecha y las coordenadas que figuran en la unidad GPS en las notas de campo.                                                                                   |
| <b>Instrucciones de envío</b>                                                                                                                                                                                                                                         |
| 1) El envío de muestras deberá iniciarse el día lunes para facilitar su recepción en Vancouver antes del fin de semana.                                                                                                                                               |
| 2) Se debe otorgar un plazo de entrega de 3 días al equipo del proyecto HHERA en Vancouver para notificar el intento de envío de las muestras. Toda la correspondencia relacionada con el envío de las muestras deberá enviarse a Adrian de Bruyn y Audrey Wagenaar.  |
| 3) Se debe indicar claramente en el formulario de declaración de entrada lo siguiente: <b>“SIN VALOR COMERCIAL – NO ES PARA CONSUMO. ÚNICAMENTE PARA FINES DE INVESTIGACIÓN”</b> . Se deberá añadir un valor nominal de \$20 en el formulario de declaración.         |
| <b>Formulario de la cadena de custodia:</b>                                                                                                                                                                                                                           |
| 1) Llenar el formulario adjunto de la cadena de custodia y <u>enviar este formulario con las muestras</u> .                                                                                                                                                           |
| 2) La cadena de custodia debe contener las siguientes instrucciones escritas: <b>“Muestras de invertebrados. Refrigerar y comunicarse con Adrian deBruyn/Audrey Wagenaar, Golder Associates Burnaby, 604-296-4200 para obtener instrucciones para los análisis”</b> . |
| 3) Enviar una copia de la cadena de custodia a Audrey Wagenaar y Adrian de Bruyn antes del envío de muestras.                                                                                                                                                         |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 1 ASEGURAMIENTO DE LA CALIDAD/ CONTROL DE CALIDAD (QA/QC)

El programa de Aseguramiento de la Calidad y Control de Calidad (QA/QC) de Golder se aplicó con el fin de obtener datos analíticos considerados como interpretables, significativos y reproducibles. En el QA/QC concerniente al laboratorio se incluyó el análisis de métodos de blanqueo y duplicados de muestras de control del laboratorio. Los siguientes criterios se consideraron como aceptables para las muestras de QA/QC del laboratorio:

- los blanqueos analíticos deberán estar por debajo de los límites de detección utilizados para el análisis específico;
- las diferencias porcentuales relativas entre las mismas muestras duplicadas deberá estar dentro del 20%; y
- los análisis se efectuaron utilizando métodos certificados por la *Canadian Association for Laboratory Accreditation (CALA)*.

En las siguientes secciones se describe los resultados de la evaluación de QA/QC para los diversos medios evaluados.

### 1.1 TEJIDO DE LOS PECES

Los resultados de QA/QC del laboratorio se incluyen en los certificados del laboratorio ALS en el Anexo XIX, Apéndice B-i. El programa de QA/QC del laboratorio para el tejido de peces incluyó el análisis de métodos de blanqueo y muestras de control del laboratorio y los resultados de las muestras cumplieron con los criterios del laboratorio en lo que se refiere a precisión, exactitud y blanqueos del laboratorio con las siguientes excepciones:

- Las diferencias porcentuales relativas entre las muestras duplicadas por lo general estuvieron por debajo de los objetivos de calidad de los datos con unas pocas excepciones. Las diferencias se atribuyen a la heterogeneidad de la muestra y los resultados aún se consideran confiables.
- La recuperación del material de referencia estuvo por debajo de los objetivos de calidad de los datos para algunos analitos. Los resultados no detectados se consideraron confiables y los resultados detectados se calificaron.
- Los límites de detección para algunos pesticidas organoclorados y naftalina se consideran elevados en algunas muestras debido a la interferencia de la matriz.
- Algunos metales y PAH se detectaron según el método de blanqueo en concentraciones cercanas al límite de detección. Para estos parámetros el límite de

reporte se ajustó en muestras con detecciones positivas por debajo de cinco veces el nivel de blanqueo.

## 1.2 DATOS DE SUELOS Y CULTIVOS

Los resultados de QA/QC del laboratorio se incluyen en los certificados de *ALS Laboratory* en el Anexo XIX, Apéndice B-i. El programa de QA/QC del laboratorio para los datos de suelo y cultivos incluyó el análisis de método de blanqueo y muestras de control del laboratorio y los resultados de las muestras cumplieron con los criterios del laboratorio en lo que se refiere a precisión, exactitud y blanqueos del laboratorio con las siguientes excepciones:

- La diferencia porcentual relativa entre las muestras duplicadas estuvieron por debajo de los objetivos de calidad de los datos con excepción del zinc. Los resultados se consideran confiables y la alta diferencia porcentual relativa (DPR) se atribuye a la heterogeneidad de las muestras.
- La recuperación del material de referencia no cumplió con los objetivos de calidad de los datos para algunos metales, entre los que se incluyen bario, manganeso, titanio y berilio. Las muestras por debajo del límite de detección se consideraron confiables y otros resultados si se reportaron, se calificaron.
- Algunos metales se detectaron según el método de blanqueo por encima de los límites de detección. El límite de reporte se ajustó en muestras con detecciones positivas por debajo de cinco veces el nivel de blanqueo.

## 1.3 INVERTEBRADOS TERRESTRES

Los resultados de QA/QC del laboratorio se incluyen en los certificados de *ALS Laboratory* en el Anexo XIX, Apéndice B-i. El programa de QA/QC del laboratorio para los datos de suelo y hojarasca incluyó el análisis de método de blanqueo y muestras de control del laboratorio y los resultados de las muestras cumplieron con los criterios del laboratorio en lo que se refiere a precisión, exactitud y blanqueos del laboratorio con sólo una excepción. La recuperación del material de referencia para el titanio y el cobre estuvo ligeramente por encima de los objetivos de calidad de los datos, y en el caso del cromo estuvo ligeramente por debajo. Las muestras con resultados por debajo del límite de detección se consideraron confiables y otros resultados si se reportaron, se cuantificaron.

**AG-DRY-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**AG-WET-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-DRY-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-WET-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-DRY-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MET-WET-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MOISTURE-TISS-VA** Tissue % Moisture in Tissues ASTM METHOD D2974-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

| This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).                                   |        |                                  |                                       |

The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).                                                                                                                              |        |                                  |                                       |
| <b>PCB-T-WET-SOX-ECD-VA</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Tissue | PCB in Tissue by Soxhlet GCECD   | EPA METHODS 3540, 3600, & 8082        |
| This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, & 8082 published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).                                                                                                                              |        |                                  |                                       |
| <b>SE-DRY-HVAAS-VA</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Tissue | Selenium in Tissue by HVAAS      | PUGET SOUND PROTOCOLS                 |
| This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).                                                                                                               |        |                                  |                                       |

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location | Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|----------------------------|---------------------|
|----------------------------|---------------------|----------------------------|---------------------|

## Reference Information

### GLOSSARY OF REPORT TERMS

*Surr* - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in enviromental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

## ALS Laboratory Group Quality Control Report

Workorder: L584322

Report Date: 06-MAY-09

Page 12 of 12

**Legend:**

---

|       |                                                     |
|-------|-----------------------------------------------------|
| Limit | 99% Confidence Interval (Laboratory Control Limits) |
| DUP   | Duplicate                                           |
| RPD   | Relative Percent Difference                         |
| N/A   | Not Available                                       |
| LCS   | Laboratory Control Sample                           |
| SRM   | Standard Reference Material                         |
| MS    | Matrix Spike                                        |
| MSD   | Matrix Spike Duplicate                              |
| ADE   | Average Desorption Efficiency                       |
| MB    | Method Blank                                        |
| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

**Sample Parameter Qualifier Definitions:**

---

| Qualifier | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                          |
| MB-LOR    | Method Blank exceeds ALS DQO. LORs adjusted for samples with positive hits below 5 times blank level. Please contact ALS if re-analysis is required. |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                          |

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-DRY-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MET-WET-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MOISTURE-TISS-VA** Tissue % Moisture in Tissues ASTM METHOD D2794-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

**OCP1-TDRY-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**OCP1-TWET-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**PCB-T-DRY-SOX-ECD-VA** Tissue PCB in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, & 8082

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, & 8082 published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).

**PCB-T-WET-SOX-ECD-VA** Tissue PCB in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, & 8082

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, & 8082 published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample

**\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:**

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

### GLOSSARY OF REPORT TERMS

*Surr - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds. The reported surrogate recovery value provides a measure of method efficiency.*  
*mg/kg (units) - unit of concentration based on mass, parts per million*  
*mg/L (units) - unit of concentration based on volume, parts per million*  
*N/A - Result not available. Refer to qualifier code and definition for explanation*

*Test results reported relate only to the samples as received by the laboratory.*  
*UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.*  
*Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.*

*ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.*

**Sample Parameter Qualifier Definitions:**

---

| Qualifier | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity.                             |
| J         | Duplicate results and limits are expressed in terms of absolute difference.                 |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

**Certificate of Analysis**

GOLDER ASSOCIATES LTD.  
ATTN: ADRIAN DE BRUYN  
500 - 4260 STILL CREEK DRIVE  
BURNABY BC V5C 6C6

Reported On: 07-NOV-08 06:11 PM  
Revision: 1

Lab Work Order #: **L680075**

Date Received: **20-MAR-08**

Project P.O. #:  
Job Reference: MARINE PANAMA FISH  
Legal Site Desc:  
CofC Numbers:

Other Information:

**Comments:** All samples were digested as whole-body except for samples L680075-1, -2 and -3 in which case a number of muscle tissue portions were taken from the samples and homogenized in order to produce a representative sample for each stingray.

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-DRY-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MET-WET-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MOISTURE-TISS-VA** Tissue % Moisture in Tissues ASTM METHOD D2794-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

**OCP1-TDRY-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**OCP1-TWET-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**PAH-T-DRY-SOX-MS-VA** Tissue PAHs in Tissue by Soxhlet GCMS EPA METHODS 3540, 3600 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.

**PAH-T-WET-SOX-MS-VA** Tissue PAHs in Tissue by Soxhlet GCMS EPA METHODS 3540, 3600 & 8270

**SE-DRY-HVAAS-VA** Tissue Selenium in Tissue by HVAAS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).

**SE-WET-HVAAS-VA** Tissue Selenium in Tissue by HVAAS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

### GLOSSARY OF REPORT TERMS

**Surr** - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds. The reported surrogate recovery value provides a measure of method efficiency.  
**mg/kg (units)** - unit of concentration based on mass, parts per million  
**mg/L (units)** - unit of concentration based on volume, parts per million  
**N/A** - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.  
 UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.  
 Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

## ALS Laboratory Group Quality Control Report

Workorder: L680075

Report Date: 07-NOV-08

Page 22 of 22

**Legend:**

---

|       |                                                     |
|-------|-----------------------------------------------------|
| Limit | 99% Confidence Interval (Laboratory Control Limits) |
| DUP   | Duplicate                                           |
| RPD   | Relative Percent Difference                         |
| N/A   | Not Available                                       |
| LCS   | Laboratory Control Sample                           |
| SRM   | Standard Reference Material                         |
| MS    | Matrix Spike                                        |
| MSD   | Matrix Spike Duplicate                              |
| ADE   | Average Desorption Efficiency                       |
| MB    | Method Blank                                        |
| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

**Sample Parameter Qualifier Definitions:**

---

| Qualifier | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                                                                                          |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.                                                                 |
| RM-L      | Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                                                                                          |

Report Date: 06-MAY-09 11:45 (MT)  
Version: FINAL REV. 2

Lab Work Order #: **L685670**

Date Received: **22-SEP-08**

Project P.O. #:  
Job Reference: PANAMA  
Legal Site Desc:  
CofC Numbers:

**Other Information:**

**Comments:** January 28, 2009 - Detection limits were increased for some Pesticides, Polycyclic Aromatic Hydrocarbons, and PCBs due to high moisture contents and required dilutions.  
May 6, 2009 - Boron data has been added for soil samples, and Boron and Silver data has been added for tissue samples in this report. All other data remains unchanged.

Amber Springer  
Account Manager

THIS REPORT SHALL NOT BE REPRODUCED EXCEPT IN FULL WITHOUT THE WRITTEN AUTHORITY OF THE LABORATORY.  
ALL SAMPLES WILL BE DISPOSED OF AFTER 30 DAYS FOLLOWING ANALYSIS. PLEASE CONTACT THE LAB IF YOU  
REQUIRE ADDITIONAL SAMPLE STORAGE TIME.

**AG-DRY-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**AG-WET-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-DRY-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-WET-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**HG-CCME-CVAFS-VA** Soil CVAFS Hg in Soil (CCME) CCME

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 7000 series).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-CSR-FULL-ICP-VA** Soil Metals in Soil by ICPOES (CSR SALM) BCMELP CSR SALM METHOD 8

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).</p>                                                                                                                                                            |        |                                  |                                          |

| <p>This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3545, 3610, 3630, 3660 &amp; 8081, published by the United States Environmental Protection Agency (EPA). The procedure uses an automated system (Accelerated Solvent Extractor - ASE) at high temperature and pressure or a Soxhlet system to extract a subsample of the sediment/soil with dichloromethane. The extract is then solvent exchanged to hexane followed by one or more of the following clean-up procedures (if required): alumina clean-up, silica gel clean-up and/or sulphur clean-up. The final extract is analysed by dual capillary column gas chromatography with electron capture detection (GC/ECD).</p> |        |                                  |                                          |

| <p>This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600 &amp; 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.</p>                                               |        |                                  |                                          |

| <p>Polycyclic Aromatic Hydrocarbons in Sediment/Soil<br/>         This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3570 &amp; 8270, published by the United States Environmental Protection Agency (EPA). The procedure uses a mechanical shaking technique to extract a subsample of the sediment/soil with a 1:1 mixture of hexane and acetone. The extract is then solvent exchanged to toluene. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.</p>                                                       |        |                                  |                                          |

The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).</p>                                                                                                                                                                                            |        |                                  |                                          |

| <p>This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at &lt;60°C) and sieved (10 mesh /2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.</p>                                                                                                                                                                                                                                                                                                                |        |                                  |                                          |

| <p>This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by either hotplate or block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method</p> |        |                                  |                                          |

## Reference Information

### Methods Listed (if applicable):

| ALS Test Code | Matrix | Test Description | Analytical Method Reference(Based On) |
|---------------|--------|------------------|---------------------------------------|
|---------------|--------|------------------|---------------------------------------|

6020A).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location | Laboratory Definition Code | Laboratory Location |

### GLOSSARY OF REPORT TERMS

*Surr - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.*

*The reported surrogate recovery value provides a measure of method efficiency.*

*mg/kg (units) - unit of concentration based on mass, parts per million*

*mg/L (units) - unit of concentration based on volume, parts per million*

*N/A - Result not available. Refer to qualifier code and definition for explanation*

*Test results reported relate only to the samples as received by the laboratory.*

*UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.*

*Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.*

*ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.*

## ALS Laboratory Group Quality Control Report

Workorder: L685670

Report Date: 06-MAY-09

Page 29 of 29

### Legend:

---

|       |                                                     |
|-------|-----------------------------------------------------|
| Limit | 99% Confidence Interval (Laboratory Control Limits) |
| DUP   | Duplicate                                           |
| RPD   | Relative Percent Difference                         |
| N/A   | Not Available                                       |
| LCS   | Laboratory Control Sample                           |
| SRM   | Standard Reference Material                         |
| MS    | Matrix Spike                                        |
| MSD   | Matrix Spike Duplicate                              |
| ADE   | Average Desorption Efficiency                       |
| MB    | Method Blank                                        |
| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

### Sample Parameter Qualifier Definitions:

---

| Qualifier | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity.                                                                                      |
| G         | QC result did not meet ALS DQO. Refer to narrative comments for further information.                                                                 |
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                          |
| MB-LOR    | Method Blank exceeds ALS DQO. LORs adjusted for samples with positive hits below 5 times blank level. Please contact ALS if re-analysis is required. |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                          |

GENF14.00

|                                                                                                                                                   |                                                                              |                                                    |      |                                                                                                                                                                                                                                                                                           |                                                 |              |  |                                                                      |  |  |  |  |  |  |  |  |  |

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-DRY-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MET-WET-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MOISTURE-TISS-VA** Tissue % Moisture in Tissues ASTM METHOD D2794-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

**OCP1-TDRY-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**OCP1-TWET-SOX-ECD-VA** Tissue OCP-1 in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, 8081 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).

**PAH-T-DRY-SOX-MS-VA** Tissue PAHs in Tissue by Soxhlet GCMS EPA METHODS 3540, 3600 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.

**PAH-T-WET-SOX-MS-VA** Tissue PAHs in Tissue by Soxhlet GCMS EPA METHODS 3540, 3600 & 8270

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the

Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.

**PCB-T-DRY-SOX-ECD-VA** Tissue PCB in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, & 8082

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, & 8082 published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).

**PCB-T-WET-SOX-ECD-VA** Tissue PCB in Tissue by Soxhlet GCECD EPA METHODS 3540, 3600, & 8082

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, & 8082 published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).

**SE-DRY-HVAAS-VA** Tissue Selenium in Tissue by HVAAS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).

**SE-WET-HVAAS-VA** Tissue Selenium in Tissue by HVAAS PUGET SOUND PROTOCOLS

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).

**\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:**

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

### GLOSSARY OF REPORT TERMS

**Surr** - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.
